Filip Meysman NIOO-CEME The Netherlands

Abstract

Rpackage **marelac** (Soetaert, Petzoldt, and Meysman 2008) contains chemical and physical constants and functions, routines for unit conversion, and other utilities useful for MArine, Riverine, Estuarine, LAcustrine and Coastal sciences.

Keywords: marine, riverine, estuarine, lacustrine, coastal science, utilities, constants, R.

1. Introduction

R-package **marelac** has been designed as a tool for use by scientists working in the MArine, Riverine, Estuarine, LAcustrine and Coastal sciences.

It contains:

- chemical and physical constants, e.g. atomic weights, gas constants.
- conversion factors, e.g. gram to mol to liter conversions; conversions between different barometric units, temperature units, salinity units.
- physical functions, e.g. to estimate concentrations of conservative substances as a function of salinity, gas transfer coefficients, diffusion coefficients, estimating the coriolis force, gravity ...
- the thermophysical properties of the seawater, as from the UNESCO polynomial (Fofonoff and Millard 1983) or as from the more recent derivation based on a gibbs funtion (Feistel 2008), (McDougall, Feistel, Millero, Jackett, Wright, King, Marion, Chen, and Spitzer 2009).

2. Constants

2.1. Physical constants

Dataset Constants contains commonly used physical and chemical constants, as in (Mohr and Taylor 2005):

2 marelac: utilities for the MArine, Riverine, Estuarine, LAcustrine and Coastal sciences

2.3. AtomicWeight

Dataset AtomicWeight holds the atomic weight of various chemical elements, as in (Wieser 2006); The data set contains NA for elements which have no stable isotopes (except U, Th,

Pa). The data set can be called in two versions. AtomicWeight shows the full table and atomicweight can be used for symbolic computations with the elements.

2.4. atmospheric composition

The atmospheric composition, given in units of the moles of each gas to the total of moles of gas in dry air is in function atmComp:

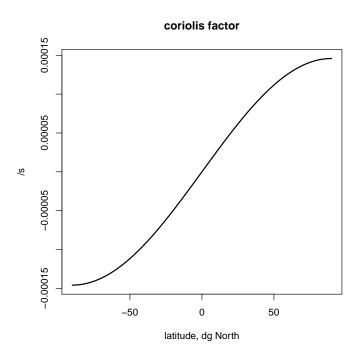

Figure 1: The coriolis function

```

```

3. physical functions

3.1. coriolis

[1] 1.000032

Function coriolis estimates the coriolis factor, f, units sec^{-1} according to the formula: $f = 2 * \omega * \sin(lat)$, where $\omega = 7.292e^{-5}radianssec^{-1}$

```
> plot(-90:90,coriolis(-90:90),xlab="latitude, dg North",
+ ylab= "/s" , main ="coriolis factor",type="l",lwd=2)
```

3.2. molecular diffusion coefficients

In function diffcoeff the molecular and ionic diffusion coefficients (m^2s^{-1}) , for several species at given salinity (S) temperature (t) and pressure (P) is estimated. The implementation is based on the code "CANDI" by Bernie Boudreau (Boudreau 1996).

```

> diffcoeff(t=10)$02
[1] 1.369619e-09
> difftemp <- diffcoeff(t=0:30)[,1:13]
> diffsal <- diffcoeff(S=0:35)[,1:13]</pre>
> matplot(0:30,difftemp,xlab="temperature",ylab=" m2/sec",
          main="Molecular/ionic diffusion", type="l")
> legend("topleft", ncol=2, cex=0.8, title="mean", col=1:13, lty=1:13,
```

3.3. shear viscosity of water

viscosity calculates the shear viscosity of water, in centipoise $(gm^{-1}sec^{-1})$. Valid for 0 < t < 30 and 0 < S < 36.

legend=cbind(names(difftemp),format(colMeans(difftemp),digits=4)))

4. dissolved gasses

4.1. saturated oxygen concentrations

gas_02sat estimates the saturated concentration of oxygen:

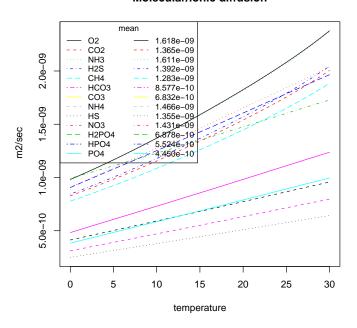

Figure 2: molecular diffusion coefficients as a function of temperature

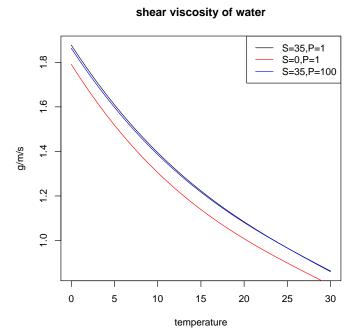

Figure 3: shear viscosity of water as a function of temperature

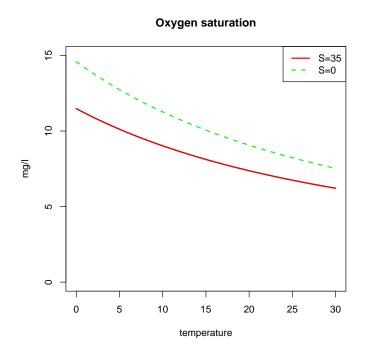

Figure 4: Oxygen saturated concentration as a function of temperature, and for different salinities

4.2. solubilities and saturated concentrations

More solubilities and saturated concentrations are in functions gas_solubility and gas_satconc.

```
> Temp<-seq(from=0,to=30,by=0.1)
> Sal <- seq(from=0, to=35, by=0.1)
> #
> mf
     <-par(mfrow=c(2,2))
> #
     <-gas_solubility(t=Temp)</pre>
> gs
      <- c("CC14", "CO2", "N20", "Rn", "CC12F2")
> matplot(Temp,gs[,x],type="l",lty=1,lwd=2,xlab="temperature",
       ylab="mmol/m3",main="solubility (S=35)")
> legend("topright",col=1:5,lwd=2,legend=x)
> x2 <- c("Kr", "CH4", "Ar", "02", "N2", "Ne")
> matplot(Temp,gs[,x2],type="1",lty=1,lwd=2,xlab="temperature",
       ylab="mmol/m3",main="solubility (S=35)")
> legend("topright",col=1:6,lwd=2,legend=x2)
> #
> x <- c("N2", "CO2", "O2", "CH4", "N2O")
> gsat <-gas_satconc(t=Temp,x=x)</pre>
> matplot(Temp,gsat,type="1",xlab="temperature",log="y", lty=1,
       ylab="mmol/m3",main="Saturated conc (S=35)",lwd=2)
> legend("right",col=1:5,lwd=2,legend=x)
> #
> gsat <-gas_satconc(S=Sal,x=x)</pre>
> matplot(Sal,gsat,type="l",xlab="salinity",log="y", lty=1,
       ylab="mmol/m3", main="Saturated conc (T=20)", lwd=2)
> legend("right",col=1:5,lwd=2,legend=x)
> #
> par("mfrow"=mf)
```

4.3. partial pressure of water vapor

vapor estimates the partial pessure of water vapor, divided by the atmospheric pressure.

```
> plot(0:30, vapor(t = 0:30), xlab = "Temperature, dgC", ylab = "pH20/P", type = "l")
```

4.4. Schmidt number and gas transfer velocity

The Schmidt number of a gas (gas_schmidt) is an essential quantity in the gas transfer velocity calculation (gas_transfer). The latter also depends on wind velocity (as measured 10 metres above sealevel).

```
> gas_schmidt(x="CO2",t=20)
```

[1] 665.988

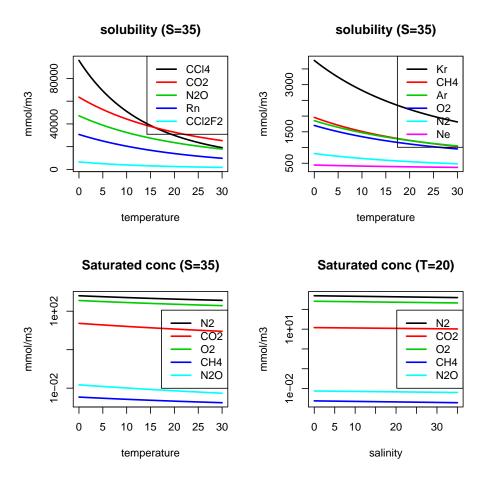

Figure 5: Saturated concentrations and solubility as a function of temperature and salinity, and for different species

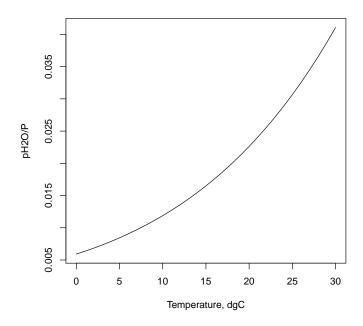

Figure 6: partial pressure of water in saturated air as a function of temperature

```
> useq <- 0:15
> plot(useq,gas_transfer(u10=useq,x="02"),type="1",lwd=2,xlab="u10,m/s",
       ylab="m/s", main="02 gas transfer velocity",ylim=c(0,3e-4))
> lines(useq,gas_transfer(u10=useq,x="02",method="Nightingale"),lwd=2,lty=2)
> lines(useq,gas_transfer(u10=useq,x="02",method="Wanninkhof1"),lwd=2,lty=3)
> lines(useq,gas_transfer(u10=useq,x="02",method="Wanninkhof2"),lwd=2,lty=4)
> legend("topleft", lty=1:4, lwd=2, legend=c("Liss and Merlivat 1986",
+ "Nightingale et al. 2000", "Wanninkhof 1992", "Wanninkhof and McGills 1999"))
```

5. seawater properties

5.1. Concentration of conservative species in seawater

Borate, calcite, sulphate and fluoride concentrations can be estimated as a function of the seawater salinity:

```
> sw_conserv(S=seq(0,35,by=5))
```

```
Calcite
                       Sulphate
                                 Fluoride
    Borate
   0.00000
                0.000
                          0.000
                                 0.00000
1
  59.42857
             1468.571 4033.633
                                 9.760629
```

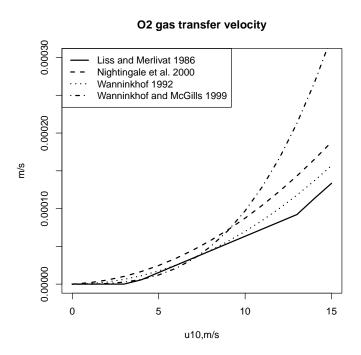

Figure 7: gas transfer velocity for seawater

```

8 416.00000 10280.000 28235.434 68.324401
```

5.2. Thermophysical seawater properties

marelac also implements several thermodynamic properties of seawater. Either one can choose the formulation based on the UNESCO polynomial (Fofonoff and Millard 1983), which has served the oceanographic community for decades, or the more recent derivation as in (Feistel 2008). In the latter case the estimates are based on three individual thermodynamic potentials for fluid water, for ice and for the saline contribution of seawater (the Helmholtz function for pure water, an equation of state for salt-free ice, in the form of a Gibbs potential function, and the saline part of the Gibbs potential).

Note that the formulations use a new salinity scale, termed "Reference composition salinity" (Millero, Feistel, Wright, and McDougall 2008).

```
> sw_cp(S=40,t=1:20)
```

```
[1] 3958.545 3959.028 3959.576 3960.180 3960.831 3961.523 3962.247
```

^{[8] 3962.997 3963.768 3964.553 3965.348 3966.148 3966.949 3967.747}

^{[15] 3968.540 3969.324 3970.098 3970.859 3971.605 3972.336}

14 marelac: utilities for the MArine, Riverine, Estuarine, LAcustrine and Coastal sciences

```
> sw_cp(S=40,t=1:20,UNESCO=TRUE)

[1] 3956.080 3955.898 3955.883 3956.021 3956.296 3956.697 3957.209
[8] 3957.819 3958.516 3959.288 3960.124 3961.013 3961.945 3962.911
[15] 3963.900 3964.906 3965.918 3966.931 3967.936 3968.927
```

Below we plot all implemented thermophysical properties as a function of salinity and temperature. We first define a function that does that

```
> plotST <- function(fun,title)</pre>
+ {
    Sal \leftarrow seq(0,40,by=0.5)
    Temp<- seq(-5,40,by=0.5)
    Val <- outer(X=Sal,Y=Temp,FUN=function(X,Y) fun(S=X, t=Y))</pre>
    contour(Sal,Temp,Val,xlab="Salinity",ylab="temperature",
            main=title,nlevel=20)
+ }
> par (mfrow=c(3,2))
> par(mar=c(4,4,3,2))
> plotST(sw_gibbs, "Gibbs function")
> plotST(sw_cp, "Heat capacity")
> plotST(sw_entropy, "Entropy")
> plotST(sw_enthalpy, "Enthalpy")
> plotST(sw_dens,"Density")
> plotST(sw_svel, "Sound velocity")
> par (mfrow=c(3,2))
> par(mar=c(4,4,3,2))
> plotST(sw_kappa, "Isentropic compressibility")
> plotST(sw_kappa_t,"Isothermal compressibility")
> plotST(sw_alpha, "Thermal expansion coefficient")
> plotST(sw_beta, "Haline contraction coefficient")
> plotST(sw_adtgrad, "Adiabatic temperature gradient")
> par (mfrow=c(1,1))
```

6. conversions

Finally, several functions are included to convert between units of certain properties.

6.1. gram, mol, liter conversions

marelac function molweight converts from gram to moles and vice versa

```
> 1/molweight("CO3")
```

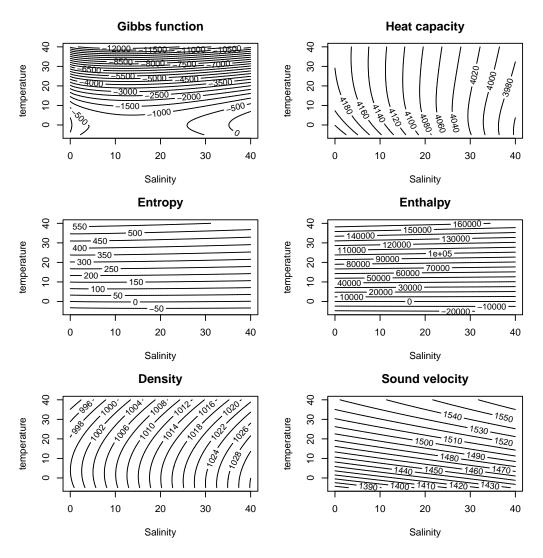

Figure 8: seawater properties as a function of salinity and temperature - see text for R-code

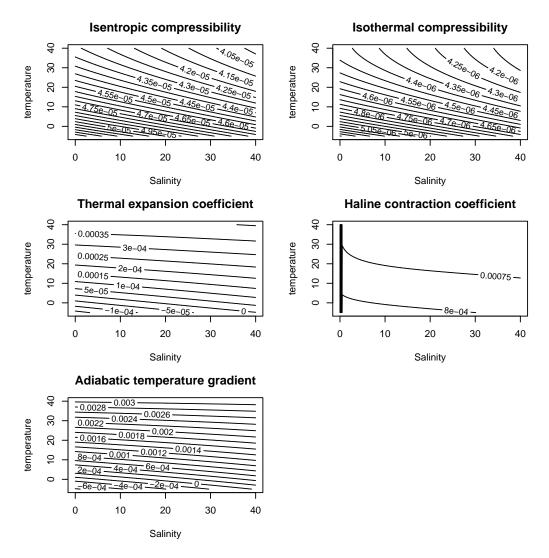

Figure 9: seawater properties as a function of salinity and temperature - continued - see text for R-code

```
C03
0.01666419
> 1/molweight("HCO3")
      HC<sub>0</sub>3
0.01638892
> 1/molweight(c("C2H5OH", "CO2", "H2O"))
    C2H5OH
                   C02
                               H20
0.02170683 0.02272237 0.05550844
> molweight(c("SiOH4", "NaHCO3", "C6H12O6", "Ca(HCO3)2", "Pb(NO3)2", "(NH4)2SO4"))
    SiOH4
              NaHCO3
                        C6H12O6 Ca(HCO3)2 Pb(NO3)2 (NH4)2SO4
 48.11666 84.00661 180.15588 162.11168 331.20980 132.13952
We can use that to estimate the importance of molecular weight on certain physical properties:
> gs <- gas_solubility()</pre>
> x <- colnames(gs)
> mw <- molweight(x)</pre>
> plot(mw,gs,type="n",xlab="molecular weight", ylab="solubility", log="y")
> text(mw,gs,x)
molvol estimates the volume of one liter of a gas. molar volume of an ideal gas
> molvol(species="ideal")
   ideal
24.46536
> molvol(species="ideal",t=1:10)
          ideal
 [1,] 22.49599
 [2,] 22.57804
 [3,] 22.66010
 [4,] 22.74216
 [5,] 22.82421
 [6,] 22.90627
 [7,] 22.98833
 [8,] 23.07039
 [9,] 23.15244
[10,] 23.23450
```

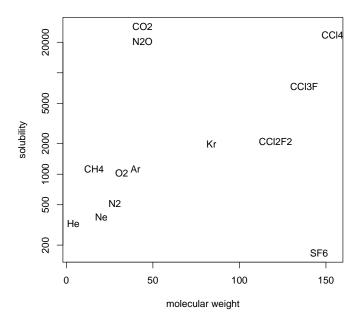

Figure 10: Gas solubility as a function of molecular weight see text for R-code

[3,] 0.014890860 [4,] 0.011168149

[5,] 0.008934518

[6,] 0.007445432

> 1/molvol(t=1:5,species=c("CO2","O2","N2O"))

```
C02 02 N20
[1,] 0.04468587 0.04450899 0.04469987
[2,] 0.04452145 0.04434659 0.04453529
[3,] 0.04435824 0.04418537 0.04437192
[4,] 0.04419623 0.04402533 0.04420975
[5,] 0.04403541 0.04386644 0.04404877
```

6.2. pressure conversions

convert_p converts between the different barometric scales:

```
> convert_p(1, "atm")
```

```
Pa bar at atm torr 1 101325.3 1.013253 1.033214 1 760.0008
```

6.3. temperature conversions

while convert_T converts between the different temperature scales (Kelvin, Celsius, Fahrenheit):

```
> convert_T(1, "C")
```

```
K C F
1 274.15 1 33.8
```

6.4. salinity and chlorinity

The relationship between Salinity, chlorinity and conductivity is in various functions:

```
> convert_StoCl(S=35)
```

[1] 19.37394

> convert_RtoS(R=1)

[1] 27.59808

> convert_StoR(S=35)

[1] 1.236537

7. finally

This vignette was made with Sweave (Leisch 2002).
